

A α5β1 blockade redistributes occupancy along a shared neutrophil continuum

Grey denotes the full reference manifold; arrow indicates imposed orientation, not measured time

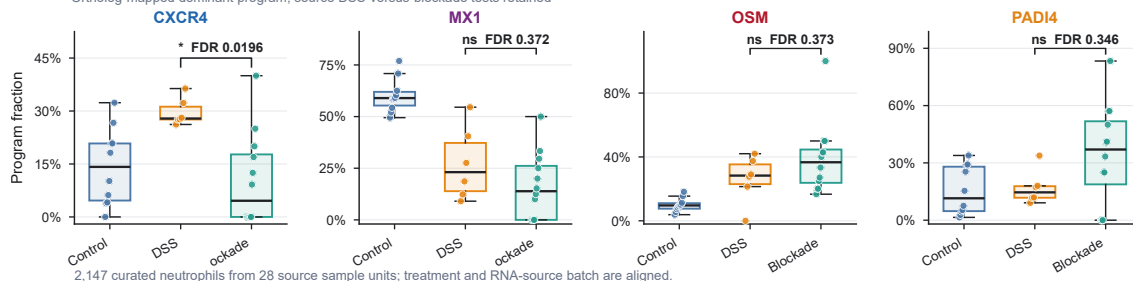

B Endpoint-state redistribution

Fractions within total neutrophils; points are source sample units

C Transferred human-associated neutrophil programs

Ortholog-mapped dominant program; source DSS-versus-blockade tests retained

D Neutrophil programs along pseudotime

Source mouse-by-bin means ± s.e.m.; observed bins only
